| 1. To describe the divisions of the central nervous system, the eye, visual pathways, the ear and vestibular system, auditory pathways and auditory system.<br>2. To examine and describe the histological structure of neurons and glial cell types in the central and peripheral nervous systems, the development of these organs, the histological structure of the meninges, the blood-brain barrier, and the histology and embryology of the skin and sensory organs.<br>3. To explain the pathways of neurotransmitter synthesis and degradation and certain biochemical abnormalities underlying neurological diseases.<br>4. To describe the general organization of the central and peripheral nervous systems, the senses, learning, memory formation, the limbic system, basal ganglia, spinal cord and reflexes; and to describe the general organization of the peripheral and autonomic nervous system mechanisms.<br>5. To describe the classification, structure and morphology, physiology, bacterial genetics, culture media, stains, sterilization and disinfection, antimicrobial agents, normal microbial flora, as well as host-microbe interactions, acquired immunity, hypersensitivity reactions, and immunological tests of microorganisms.<br>6. To develop a multidisciplinary perspective on health problems and diseases. |             |                                                                                                                               |       |                                                                                                                                                                     |
